

The 0.1% Window.

The AI tool stack that turns one person into a team. Before everyone else catches up.

THE THESIS

Jobs aren't going away evenly. Task-based ones go first.

Block cut 4,000 of 10,000 staff while posting record profits. Oracle and Meta announced large cuts in the same window. None of these companies blamed the economy. Markets rewarded the cuts. This is not a downturn pattern. It's a structural one.

4,000BLOCK STAFF CUT WHILE
PROFITS CLIMBED**~30%**ORACLE GLOBAL
WORKFORCE REDUCTION**0.1%**OF WORKERS RUNNING A
COORDINATED AI STACK
TODAY

The mistake is reading this as a warning. It isn't. It's a positioning window. The race has reset to zero. Past credentials no longer rank-order the field. The people who learn to operate the new tool stack in the next 18 months will out-earn the people who waited for clarity.

THE FRAMEWORK / SIX MOVES

MOVE 01

Map the exposure

Find your role on the Anthropic Economic Index. That number is your baseline.

MOVE 02

Trade tasks for purpose

If-this-then-that is exposed. Why-this-then-that compounds.

MOVE 03

Hire an AI employee

Not a tool. An employee. Runs on a schedule, learns, reports back.

MOVE 04

Build the job-hunt pipeline

Sourcing, tailoring, cold emails, applications. Submitted overnight.

MOVE 05

Run prep as a product

Custom prep app per role. Built in five minutes. Drilled in twenty.

MOVE 06

Build the command muscle

Specifying outcomes is the new bottleneck. Brief quality is output quality.

THE SINGLE SHARPEST IDEA

Task or purpose. Pick the side you're on.

A task is send the email. A purpose is why you're sending it. AI is now competent at every task. Not at deciding which task matters.

Walk through your own week. Count the hours spent on work that follows *if X happens, do Y*. That is the share of your job at risk. Count the hours spent on work that involves judgment about whether Y is the right response at all. That is the share that compounds.

“If your job is automatable, how much is your job worth?”

The corollary is uncomfortable. Most office workers spent years optimizing for the first category, because that is what got rewarded. The reward signal has flipped. Optimizing for task-completion now produces a replaceable employee.

THE FILTER

Tasks live inside processes you can document. Purpose lives in the judgment about whether the process should exist at all. The first is rentable. The second is not.

THE MENTAL SHIFT

Stop using AI as a tool. Start treating it as a hire.

Tools wait for you. Employees run on a schedule. The difference is structural, not semantic.

Most people use AI as a smarter search engine: open a chat, ask a question, close the tab. An AI employee is different. It runs on a schedule. It has persistent memory. It learns what you want. It works while you sleep.

THE BASE STACK

CORE

Hermes Agent (open source)

Self-learning agent framework. Remembers what you teach it. Spawns sub-agents for parallel work. The most reliable open-source option currently in use.

HOST

Hostinger VPS / OpenRouter

Hostinger runs Hermes 24/7 (~800 INR per month, one-click deploy). OpenRouter is the brain Hermes plugs into: roughly 370 models behind one interface. Swap to Kimi M2 for cheap agent work, Claude or GPT for the heavy lifts.

TOTAL STACK COST

Hostinger hosts. Hermes orchestrates. OpenRouter supplies intelligence. Telegram or Slack is the command interface. Setup: under an hour. Running cost: roughly 1,000 to 2,000 INR per month total.

USE CASE A / THE JOB-HUNT PIPELINE

HUNT

Claude with Indeed connector / Comet / Perplexity Computer

Daily scrape of LinkedIn, Indeed, YC jobs, and company career pages filtered by your criteria. The same model then ranks 100 matches against your resume and tailors the top 5 to pass the Applicant Tracking System layer.

APPLY

OpenAI Codex with Computer Use plugin

Codex runs its own browser cursor in parallel, so you can keep working on your machine while it fills application forms overnight. Daily human time after setup: five minutes to review.

USE CASE B / INTERVIEW PREP AS A PRODUCT

BUILD

Perplexity Computer + ChatGPT Voice Mode

Perplexity Computer builds a custom prep app from the JD and your resume: 80 questions, model answers, coaching, in under five minutes. ChatGPT Voice Mode then runs the mock interview out loud as a hard interviewer, with end-of-session analysis.

Specifying is the new skill. **Asking** is the old one.

The bottleneck is no longer technical. It is the ability to state clearly what you want as an outcome. Treat every AI interaction as if you are briefing a fast, capable, entirely literal contractor. The contractor will do exactly what you ask. The quality of the output is the quality of the brief.

THE FIVE COMPONENTS OF A GOOD BRIEF

Outcome (what you want at the end) / **Format** (PDF, email, table, app) / **Constraints** (length, sources, exclusions) / **Deadline** (when) / **Stop condition** (when to stop, not just start)

FOUR MOVES THIS MONTH

WEEK 01 / SEE

Find your exposure level.

Open the Anthropic Economic Index. Find your role. Note the level. That number is your baseline.

WEEK 02 / BUILD

Set up one AI employee.

Hermes on Hostinger for the powerful version. Zapier Agents for the fastest start. One job: daily research, fixed time.

WEEK 03 / STACK

Add a second. Then a third.

The compound value starts at three. Most stop at one because the first feels like an accomplishment.

WEEK 04 / SPEAK

Specify, don't ask.

On every AI interaction, state outcome, format, constraints, deadline, stop. Track the quality difference.

**The race got reset to zero.
Most people are still arguing about
whether the starting gun fired.**
